Problem Statement

My Next Book...

During the last few decades, with the rise of Youtube, Amazon, Netflix, and many other such web services, recommender systems have become much more important in our lives in terms of providing highly personalized and relevant content.

The main objective is to create a recommendation system to recommend relevant books to users based on popularity and user interests.

Data Summary

1. The dataset is comprised of three csv files: **1) users 2) books 3) ratings**

Users_dataset

- User-ID(unique for each user)
- Location (contains city, state and country separated by commas)
- Age
- ➢ Shape of Dataset- (278858,3)

Books_dataset

- ISBN (unique for each book)
- Book-Title
- Book-Author
- Year-Of-Publication
- Publisher
- Image-URL-S
- Image-URL-M
- Image-URL-L
- ➢ Shape of Dataset - (271360,8)

Ratings_dataset

- User-ID
- ISBN
- Book-Rating
- ➢ Shape of Dataset -(1149780,3)

Observations from "Users" dataset(Age)

- The Age range given here is from 0 to 250.
- Outliers are in the Age column.

```
1 sns.distplot(users.Age)
```
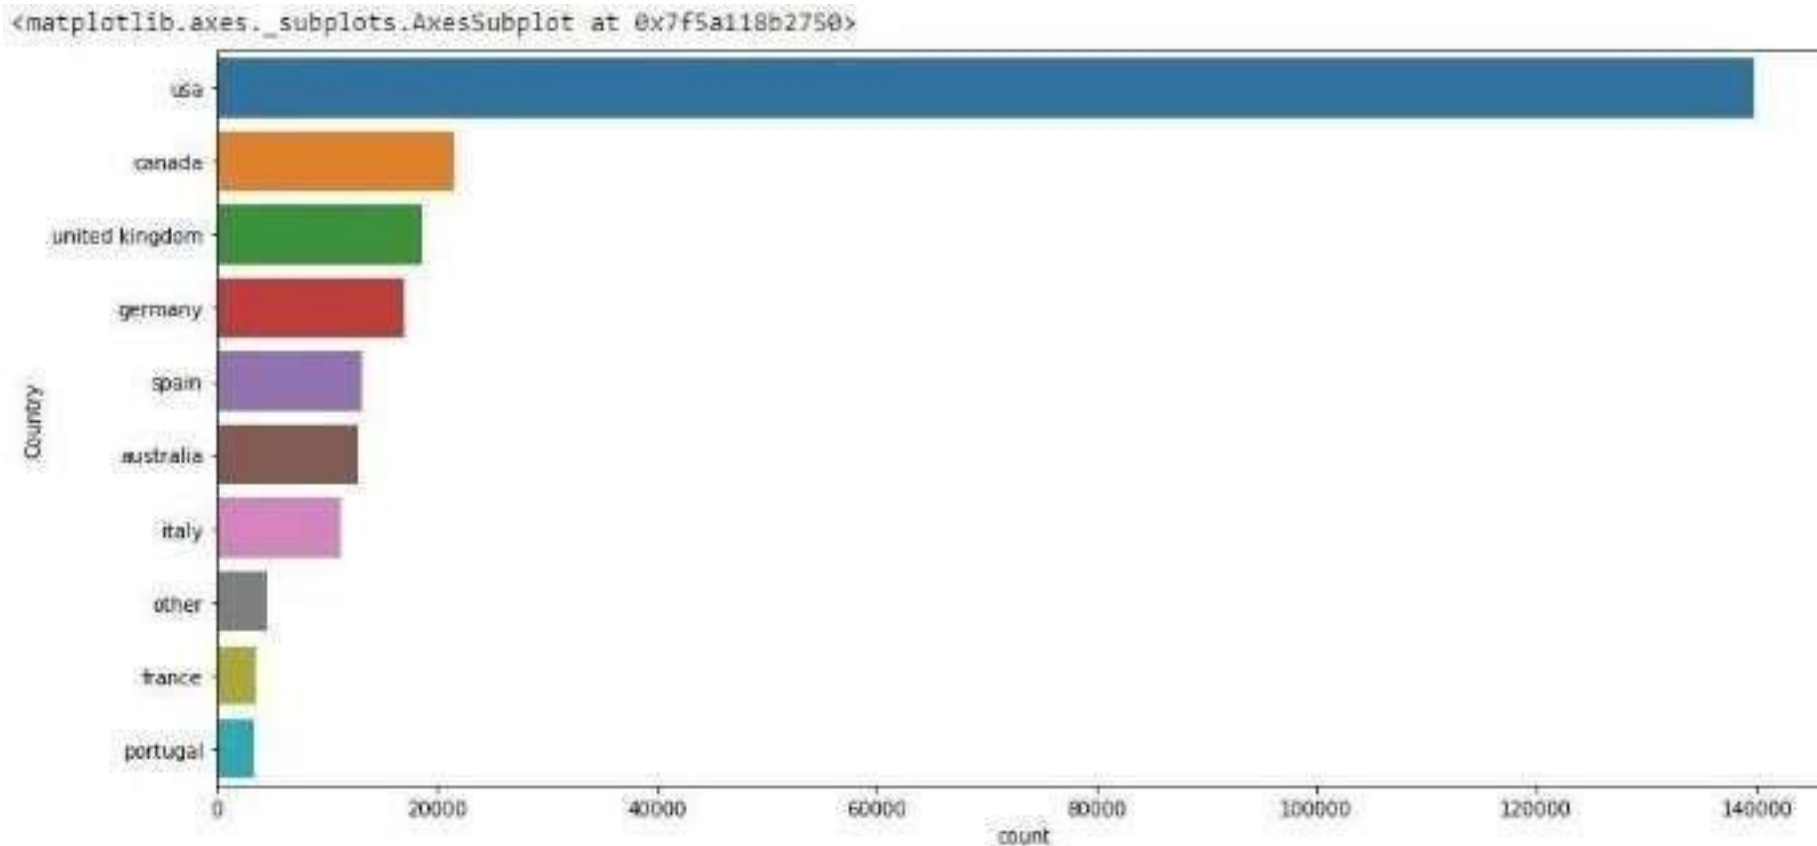

<matplotlib.axes._subplots.AxesSubplot at 0x7f5a11ac00d0>
Here is the AGE DISTRIBUTION graph and we found that-

- The Age range distribution is right skewed

- Most active readers lie in age group 20-40

Age Distribution

Here we are Splitting **Location** column and analysing country and found that

● The most active readers are from USA**.**

# Observations from "books" dataset(Authors)

- Agatha Christie wrote highest number of books in our given dataset

# Observations from "books"dataset(Publishers)

- Harlequin published highest number of books in our given dataset.

Observations from "Ratings" dataset

- Higher ratings are more common amongst users
- Rating 8 has been rated the highest number of times

Data Cleaning from "users" dataset

1. Null Value Imputation:

Age column has 40% of missing values

index	Missing Values	% of Total Values	Data_type
0	Age	110762	39.72	float64
1	User-ID	0	0.00	int64
2	Location	0	0.00	object

Imputing missing values

As we know that the outliers are in **Age** column and
Age has positive Skewness (right tail) so we can use **median** to fill **Nan values**

Find outlier data in Age column
Data Cleaning from "books" dataset

1. Null Value Imputation:

```
books_df.isnull().sum()
```

```
ISBN                   0
Book-Title             0
Book-Author            1
Year-Of-Publication    0
Publisher              2
Image-URL-S            0
Image-URL-M            0
Image-URL-L            3
dtype: int64
```

Replacing *strings* by *int* values

	ISBN	Book-Title	Book-Author	Year-Of-Publication	
209538	078946697X	DK Readers: Creating the X-Men, How It All Beg...	2000	DK Publishing Inc	ht
221678	0789466953	DK Readers: Creating the X-Men, How Comic Book...	2000	DK Publishing Inc	h

Different Models

1) Popularity Based Recommendation

Book weighted average formula:

Weighted Rating(WR) = [vR/(v+m)]+[mC/(v+m)]

Where,

V is the number of votes for the books; m is the
minimum votes required to be listed in the chart R is the
average rating of the book and
C is the mean vote across the whole report.

	Book-Title	Total_No_Of_Users_Rated	Avg_Rating	Score
0	Harry Potter and the Goblet of Fire (Book 4)	137	9.262774	8.741835
1	Harry Potter and the Sorcerer's Stone (Harry Potter (Paperback))	313	8.939297	8.716469
2	Harry Potter and the Order of the Phoenix (Book 5)	206	9.033981	8.700403
3	To Kill a Mockingbird	214	8.943925	8.640679
4	Harry Potter and the Prisoner of Azkaban (Book 3)	133	9.082707	8.609690
5	The Return of the King (The Lord of the Rings, Part 3)	77	9.402597	8.596517
6	Harry Potter and the Prisoner of Azkaban (Book 3)	141	9.035461	8.595653
7	Harry Potter and the Sorcerer's Stone (Book 1)	119	8.983193	8.508791
8	Harry Potter and the Chamber of Secrets (Book 2)	189	8.783069	8.490549
9	Harry Potter and the Chamber of Secrets (Book 2)	126	8.920635	8.484783
10	The Two Towers (The Lord of the Rings, Part 2)	83	9.120482	8.470128
11	Harry Potter and the Goblet of Fire (Book 4)	110	8.954545	8.466143
12	The Fellowship of the Ring (The Lord of the Rings, Part 1)	131	8.839695	8.441584
13	The Hobbit : The Enchanting Prelude to The Lord of the Rings	161	8.739130	8.422706
14	Ender's Game (Ender Wiggins Saga (Paperback))	117	8.837607	8.409441
15	Tuesdays with Morrie: An Old Man, a Young Man, and Life's Greatest Lesson	200	8.615000	8.375412
16	Charlotte's Web (Trophy Newbery)	68	9.073529	8.372037
17	Dune (Remembering Tomorrow)	75	8.973333	8.353301
18	A Prayer for Owen Meany	181	8.607735	8.351465
19	Fahrenheit 451	164	8.628049	8.346969

Different Models

2) Model based collaborative filtering

SVD

```
test_rmse    1.602152

43	23	31	188	0.122	0.165	248718

Conclusion

- In EDA, the Top-10 most rated books were essentially novels. Books like '**The Lovely Bone**' and '**The Secret Life of Bees**' were very well perceived.

- Majority of the readers were of the age bracket 20-35 and most of them came from North American and European countries namely USA, Canada, UK, Germany and Spain.

- If we look at the ratings distribution, most of the books have high ratings with maximum books being rated 8. Ratings below 5 are few in number.

- Author with the most books was Agatha Christie, William Shakespeare and Stephen King.

- For modelling, it was observed that for model based collaborative filtering SVD technique worked way better than NMF with lower Mean Absolute Error (MAE).

<u>Conclusion</u>

A recommendation system helps an organization to create loyal customers. The recommendation systems today are very powerful that they can handle the new customer too who has visited the site for the first time. They recommend the products which are currently trending or highly rated and they can also recommend the products which bring maximum profit to the company.

Challenges

- Handling of sparsity was a major challenge as well since the user interactions were Not present for the majority of the books.

- Understanding the metric for evaluation was a challenge as well.

- Since the data consisted of text data, data cleaning was a major challenge in features like Location etc.

- Decision making on missing value imputations and outlier treatment was quite challenging as well.

Future Scope

- Given more information regarding the books dataset, namely features like Genre, Description etc, we could implement a content-filtering based recommendation system and compare the results with the existing collaborative-filtering based system.

- We would like to explore various clustering approaches for clustering the users based on Age, Location etc., and then implement voting algorithms to recommend items to the user depending on the cluster into which it belongs.

THANKYOU
